

No more passwords! .

Bob turns his Personal Computer (PC) on and starts reading his emails. Two minutes later, Bob is leaving his office.

At no point in time does Bob have to perform any login or logout action (entering his username/password) on that PC.

How does this work?

By touching the computer mouse (a mouse that is eGo-Compliant) or the computer eGo-keyboard, Bob starts the eGo pairing between the eGo compliant device (e.g. the keyboard or the mouse) and the eGo device (e.g. a watch, a belt,..) that is located on his body. The eGo pairing done, the computer and eGo have a logical channel of communication on which they can exchange credentials.

As soon as Bob has finished reading his e-mails and leaves the office, Bob gets out of range of the wireless system and the PC performs an automatic logout.
